J.A.R.V.I.S

Just A Rather Very Intelligent System

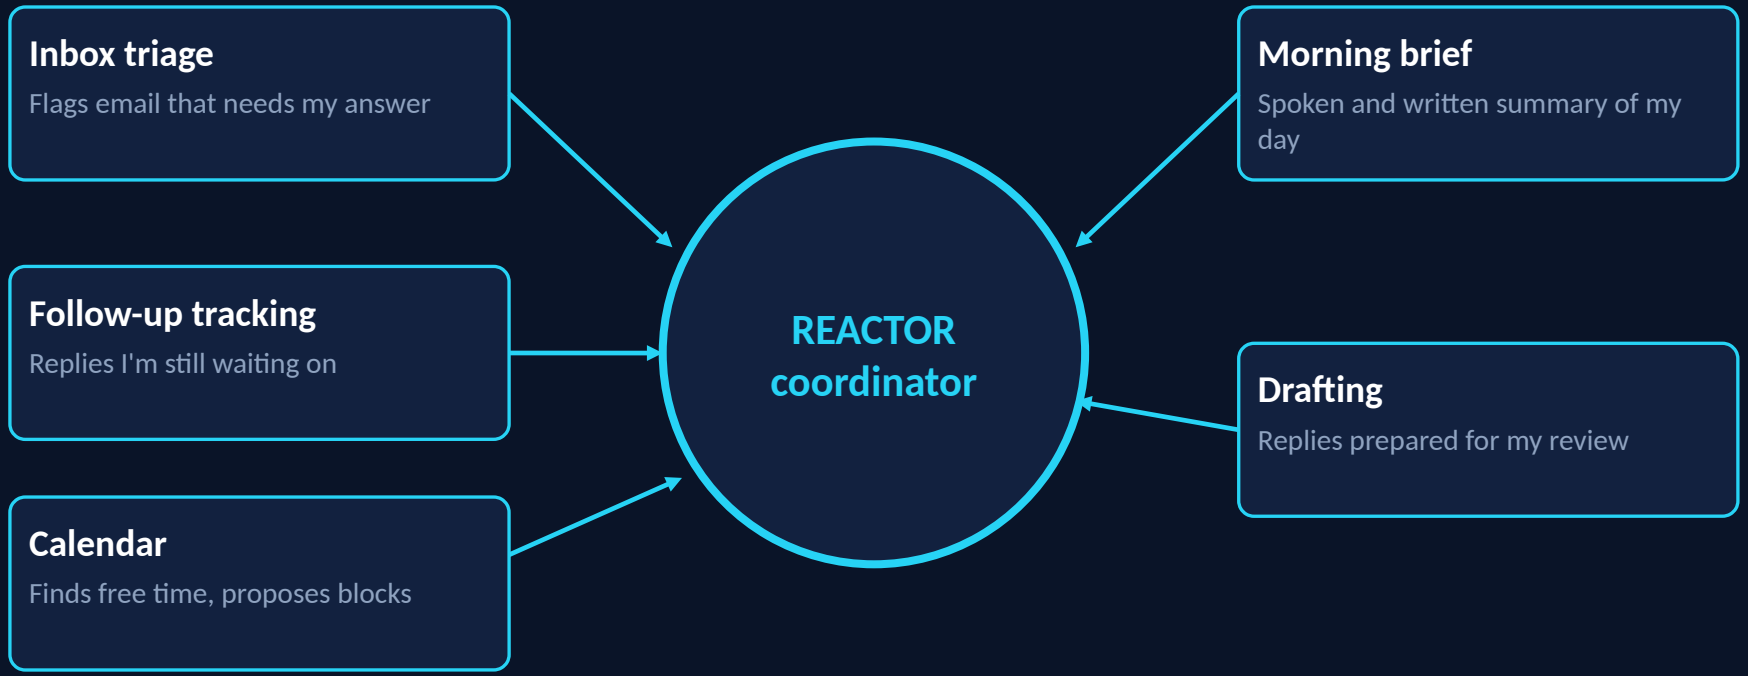

A proactive personal AI work assistant: how the architecture works today

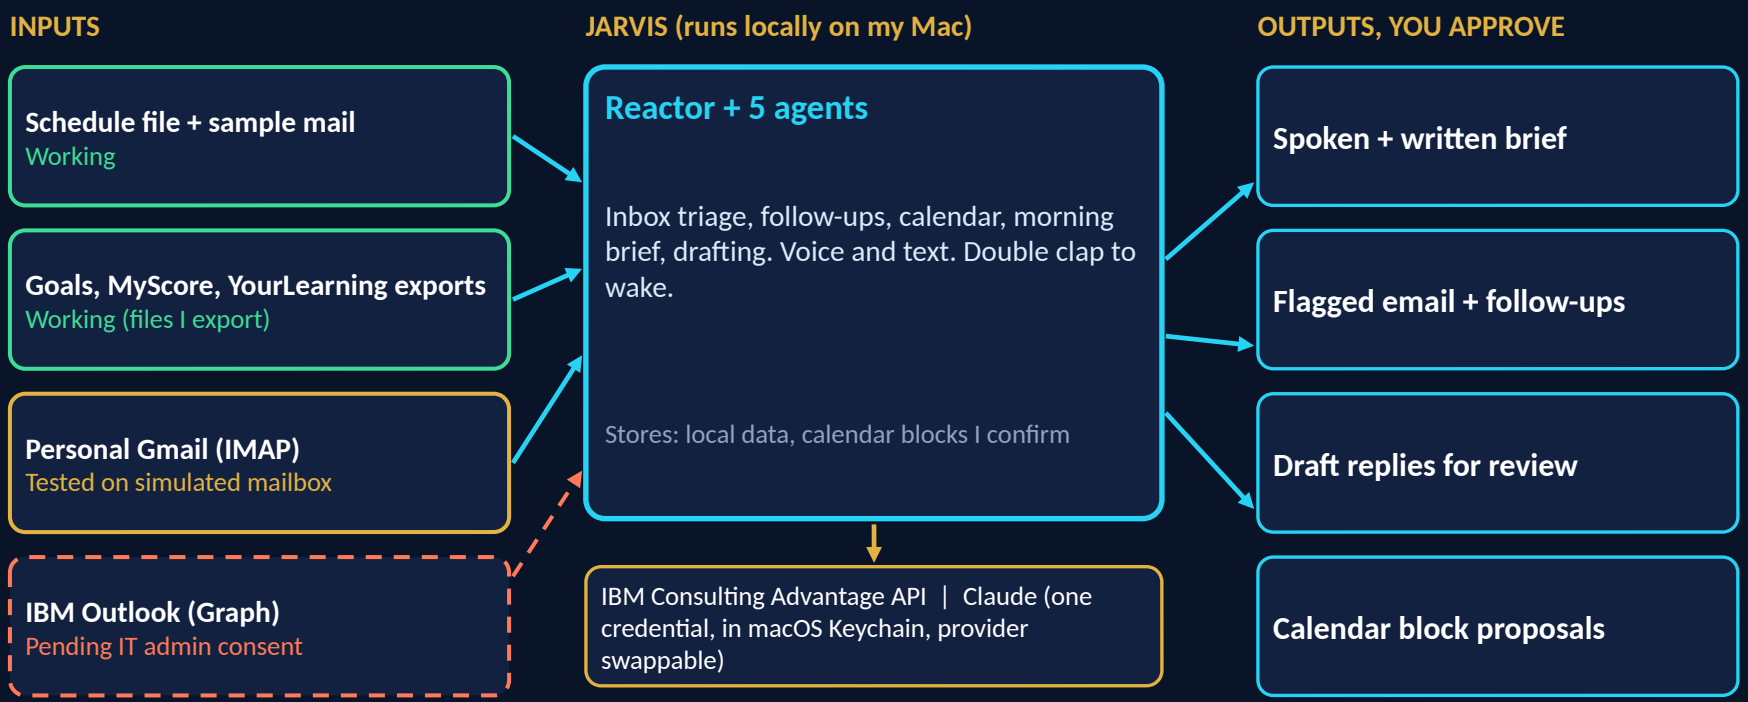

Generative AI Experience badge | Built with IBM Consulting Advantage and Claude

Many agents, one interface

Each job has its own agent. A central reactor on the dashboard coordinates them.

Architecture today

Nothing is sent or changed without my approval

Bringing in my IBM work data

Next step, only with approval: a browser extension that reads my own data while I'm logged in.

Behind w3id sign-in

"A credential is due this quarter" | *"Two courses in your queue fit this week's free time"*

Trust and guardrails

Human in the loop
No send and no calendar change without my click

Credentials protected
API key in macOS Keychain, not in code

Data boundary
Model calls go through IBM Consulting Advantage

Stay in my lane
Only files I export. No scraping of IBM portals

Honest assistant
Reports only actions actually completed

Ask first
Talk to permissions and security teams before any connector

Where it stands and what's next

Done

- Blueprint and architecture
- Working UI prototype
- Agents on sample data
- Spoken and written brief
- Goal files, schedule file mode

In progress

- Personal Gmail, tested on a simulated mailbox
- Live checks against ICA

Next, with approval

- IBM Outlook (IT admin consent)
- Browser extension for my own w3 data
- Permissions and security conversation
